

Abstract of the Disclosure

A command and control system uses J2EE compliant format signals to communicate to the track management system. The track management system operates on an application server arrangement including one or more J2EE compliant application servers. The track management system uses Enterprise Java Beans software components, which are allocated among the various CPUs of the computer processing arrangement by the application server arrangement. Thus, commercial off-the-shelf equipment can be used pursuant to commercial standards to obtain the reliability associated with ready allocation of the Enterprise Java Beans among any of the available CPUs or clusters of CPUs.
